

ABSTRACT

The invention relates to a method for generation of a list of favourite services (FAVi) in a receiver (1) suitable for receiving audio and/or video digital services

5 comprising means of storage (4) of a first list of available services (LG) in which each service possesses a unique identifier. The method comprises the steps of recovery of a second list of services (TDS) comprising for each service the unique identifier and at least one value of selection criterion; of determination of a subset of the second list of services as a function of at least one criterion for

10 selecting and creating the said list of favourite services on the basis of the common services between the first list of available services and the subset of the second list of services. The invention also relates to a corresponding receiver.
